

The female<male same-gender gap is a CAST-COMPOSITION artefact, not behaviour

big gap: Cliff's $\delta = -0.89$, $p = 0.0010$

gap gone: Cliff's $\delta = +0.00$, $p = 1.00$ (null)

How to read: each dot = one film's protagonist; thick bar = group median. Left shows a real raw gap; right shows it vanishes once we compare each lead to their own cast.
